AB Three new ether- and ether-quinoxaline-containing monomers, 4-aminophenoxy-isophthalic acid, 2,3-bis(4-aminophenyl)quinoxaline-6-carboxylic acid (1), 2,3-bis(4-aminophenyl)quinoxaline-6-carboxylic acid (2) and 2,3-bis[4-(4-aminophenoxy)phenyl]quinoxaline-6-carboxylic acid (3) were prepared. They are A2B and AB2 monomers where A=CO2H and B=NH2 which were polymerized via Yamazaki reaction to form the resp. hyperbranched aromatic polyamides with -NH2 and -CO2H as reactive chain-end groups. Preliminary results on the curing and thermal properties of two hyperbranched polyamides blended in small amts. with a common bismaleimide (1,1'-(Methylenedi-4,1-phenylene)bismaleimide, BMI) resin are described. The hyperbranched polymer derived from 2 appeared to be able to initiate free radical polymerization of BMI.

AB Reactions of 2,3,5,6-tetra(2-pyridinyl)pyrazine (tppz) with [ML6][X]2 (L = CH3CN, H2O; X = [BF4]-, [ClO4]-, [NO3]-, [BarF]- [BarF = B[3,5-C6H3(CF3)2]4]) lead to the high-yield formation of mononuclear [M(tppz)2]2+, (M = MnII, FeII, CoII, and NiII) and dinuclear [Ni2(tppz)(CH3CN)6]4+ species. The new compds. were fully characterized by x-ray crystallog., spectroscopic, and magnetic susceptibility measurements. Surprisingly, the 2:1 M:tppz reactions did not give the dinuclear species except in the case of Ni(II). Furthermore, even in the case of the Ni reactions, the nuclearity of the product depends on the choice of anions and the reaction conditions. Magnetic measurements of mononuclear [Co(tppz)2]2+ revealed thermally induced spin-crossover behavior from a high-spin S = 3/2 at higher temps. to a low-spin S = 1/2 complex at lower temps. Dinuclear [Ni2(tppz)(CH3CN)6]4+ exhibits a weak anti-ferromagnetic interaction through the bridging tppz ligand.

- AB 2-Substituted amino-3-(1-pyrazolyl)quinoxalines, e.g., I, 4-11 were prepared by reacting 2-chloro-3-hydrazinoquinoxaline II with 1,3-dicarbonyl compds. followed by treatment of the resulting 2-chloro-3-(1-pyrazolyl)quinoxalines with the proper 2° amine. Reacting II with pyruvic acid or its Et ester afforded the corresponding hydrazone. Upon treating the hydrazone III with POC13, the corresponding [1,2,4]triazino[4,3-a] quinoxaline was prepared. Further, a series of 4-(piperazinyl) tetrazolo[1,5-a]quinoxalines, e.g., IV, was prepared by reacting II with nitrous acid followed by treatment of the resulting 4-chlorotetrazolo[1,5-a]quinoxalines with 1-substituted piperazines. Biol. testing of some of the prepared compds. revealed that these compds. may have antidepressant activity and compound I has the most pronounced effect.

AB Mixed-metal supramol. complexes are of interest in that they link multiple structural components into a large supramol. array. Each subunit is designed to perform a simple act and those acts combine together to give rise to more complicated device functions. By variation of the nature or type of components used and their structural position within the supramol. assembly, the type of functioning of the mol. device can be controlled. Our mol. design uses transition metal polyazine light absorbers (LA) and couples them through bridging ligands (BL) to other metal centers of interest. These addnl. metals can function as bioactive sites (BAS), electron acceptors (EA) and electron collectors (EC). An overview of our work in this area will be described with a focus on how component modulation allows these systems to be applicable to a large array of problems of interest including multifunctional DNA binding agents and photochem. mol. devices for light energy conversion.

AB An improved, less expensive route to a high-performance poly(aryl ether phenylquinoxaline) has been developed. Thus, an isomeric mixture of self-polymerizable (A-B) quinoxaline monomers, 2-(4-hydroxyphenyl)-3-phenyl-6-chloroquinoxaline and 3-(4-hydroxyphenyl)-2-phenyl-6-chloroquinoxaline, was prepared by the condensation of 1,2-diamino-4-chlorobenzene with 4-hydroxybenzil. The mixture was polymerized at 200C in benzophenone containing potassium carbonate and a freshly prepared copper(I)chloride/quinoline catalyst mixture. The polymer obtained displayed an intrinsic viscosity of 1.53 dL/g (m-cresol at 30.0±0.1°) and a glass transition temperature of 252° (DSC), similar to samples prepared previously from an analogous fluorine-substituted mixture
